New anti-interferon alpha monoclonal antibody, 9F3, useful for treating autoimmune diseases e.g. insulin-dependent diabetes mellitus, systemic lupus erythematosus and autoimmune thyroiditis.

Disclosure; Page 98; 100pp; English.

The present invention relates to novel anti-interferon alpha (IFNalpha)

The anti-IFNalpha monoclonal antibodies of the invention are useful for treating autoimmune diseases such as insulin-dependent diabetes mellitus, systemic lupus erythematosus and autoimmune thyroiditis. They are useful as reagents in diagnostic assays for IFN-alpha expression, for the affinity purification of various IFN-alpha subtypes from recombinant cell culture or natural resources and for the detection of IFN-alpha in diagnostic assay methods. Sequences of the invention are also useful in antibody therapy. The present sequence is anti-human IFNalpha monoclonal antibody 9F3 version 13 (V13) heavy chain
This sequence represents the heavy chain of the humanised H52 antibody. The H52 antibody can be used in the method of the invention. The method is for treating focal ischaemic stroke, i.e. damage to the brain due to interrupted blood supply, in a mammal, caused by obstruction of a main cerebral artery, comprises administering anti-CD18 antibody to increase cerebral blood flow and/or reduce the size of the area of brain that
                                                                                                                                                                                                                                                           Administering an anti-CD18 antibody to treat focal ischaemic stroke -increasing cerebral blood flow and reducing size of brain infarct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Humanised antibody; HuH52; heavy chain; focal ischaemic stroke; embolism; brain damage; anti-CD18 antibody; cerebral blood flow; thromboembolism; transient ischaemic attack; thrombolytic therapy; thrombosis; therapy; systemic hypoperfusion; cardiac arrest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Heavy chain
                                                                                                                                                                                                      Disclosure;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     19-MAR-1998

Treatment with anti-CD18 antibodies can increase cerebral blood flow and/or reduce brain infarct size, improving clinical outcomes in focal ischaemic strokes in mammals, particularly in humans. The method provides an alternative to thrombolytic therapy for treating ischaemic strokes caused by thrombolism (thrombosis or embolism), particularly where thrombolytic therapy has been unsuccessful, is contra-indicated e.g. because such drugs exacerbate bleeding, or is unsuitable because of the time delay between stroke onset and diagnosis. Thrombolytic agents (e.g. tissue plasminogen activator) may also be administered before, after or simultaneously with the anti-CD18 antibody. Alternatively, the method can be used to treat the third main type of ischaemic stroke, systemic hypoperfusion, e.g. resulting from cardiac arrest or drowning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 232 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               has cerebroprotective properties. The invention particularly describes a method of treating focal ischaemic stroke caused by the obstruction of a main cerebral artery which comprises administering an anti-CD18 antibody to increase the blood flow or reduce the infarct size, where: (1) the antibody binds to an extracellular domain of CD18 and inhibits or reduces the ability of the cell expressing CD18 to bind to endothelium, (2) the antibody binds CD18 with an affinity of less than 4 nm, or (3) the antibody dissociates CD11b/CD18 complex. This sequence represents the human antibody huH52 heavy chain region
                        The invention relates to a method or reducing infarct size in focal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          focal ischaemic stroke; main cerebral artery;

The method is used to improve the clinical outcome in a ischaemic stroke and to provide an alternative to thrombolytic for treating thromboembolic stroke, particularly where thrombol therapy has been unsuccessful or is contra-indicated. The prese sequence represents a humanised H52 antibody (huH52) Fab, heavy used in the method of the invention

The anti-CD18 antibody is a CC chumanised H52 antibody (huH52 Pab). The anti-CD18 antibody binds to an CC extracellular domain of CD18 and inhibits or reduces the ability of a CC cell expressing CD18 to bind to endothelium. The anti-CD18 antibody binds CC CD18 with an affinity of 1-4 mm or less. The anti-CD18 antibody binds to the epitope bound by H52 antibody. The anti-CD18 antibody and the tPA are cell expressing cerebral body. The anti-CD18 antibody and the tPA are complex. The antibody and the tPA are complex to the mammal, or the anti-CD18 antibody is administered to the mammal, or the mathemal. The method is CC useful in increasing cerebral blood flow and/or reducing infarct size in CC coll ischaemic stroke caused by obstruction of a main cerebral artery in CC a human. The antibodies are particularly useful for treating stroke. CC unlike previous methods, the new method of treatment does not require CC prior administration of a thrombolytic agent to the mammal in order to CC undown an embolus/thrombus, and therefore increases cerebral blood flow and/or reduces infarct size. The present sequence represents the heavy creating for huH52 Fab.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

Best Local &
The present invention relates to a stable aqueous ph formulation, comprising an antibody not subjected to lyophilization, an acetate buffer of pH 4.8-5.5, a s polyol. The invention is useful for treating hemorrh injury, e.g. resulting from burns, stroke including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence is that of the heavy chain of a humanized murine anti-CD18 antibody rhumab CD18. It can be used for the treament of disorders which include haemorrhagic shock, thermal injury (such as that resulting from burns), stroke (including ischaemic and haemorrhagic stroke) and myocardial infarction. The antibody formulation can be stabilised at a temperature of 2-8 deg. C for at least one year or at a temperature of deg. C for at least one stabilised stabilised at a temperature of 2-8 deg. C for at least one year or at a temperature of deg. C for at least one month and is stable following freezing and
                                                                                                                   Stable aqueous pharmaceutical formulation for treating hemorrhagic shock, thermal injury, stroke, and myocardial infarction, comprises an antibody
                                                                                                                                                                                                                                                                                                                                                                              Antibody; lyophilization; hemorrhagic shock; thermal injury; myocardial infarction; inflammation.
                                                                            Example 1, Fig 1, 56pp; English.

                A method has been developed for recovering a polypeptide comprising: (a) exposing a composition comprising a polypeptide to a reagent which binds to or modifies the polypeptide, where the reagent is immobilized on a solid phase; and (b) passing the composition through a filter bearing an opposite charge to the reagent so as to remove leached reagent from the composition. The present invention also describes a method for modifying a precursor antibody comprising a leucine zipper by exposing the precursor antibody to a protesse immobilized on a solid support so that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Key

They are especially useful for isolating antibodies. The methods overcome the problem of reagent leakage into t protein as is the case in prior art immobilized modification systems. using a opposite charge filter the reagent can be excluded from the sample, preventing contamination. The present sequence represents the recombinant humanised anti-CD18 antibody (rhuMAb CD18) heavy chain, while used in an example from the present invention

```

The sequence is that of the pS1130 encoded heavy chain of a humanize murine anti-CD18 antibody rhuMAb CD18. It can be used for the treame disorders which include haemorrhagic shock, thermal injury (such as resulting from burns), stroke (including ischaemic and haemorrhagic stroke) and myocardial infarction. The antibody formulation can be

humanized

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
A method has been developed for recovering a polypeptide comprising: (a) exposing a composition comprising a polypeptide to a reagent which binds to or modifies the polypeptide, where the reagent is immobilized on a solid phase; and (b) passing the composition through a filter bearing an opposite charge to the reagent so as to remove leached reagent from the composition. The present invention also describes a method for modifying a precursor antibody comprising a leucine zipper by exposing the precursor antibody to a protease immobilized on a solid support so that
                                                                                                                                                                                                                                                                                          New method for recovering polypeptides from cell cultures with reagent and filtering to remove reagent.
                                                                                                                                                                                                                                             Example;

       The present invention relates to a stable aqueous pharmaceutical formulation, comprising an antibody not subjected to prior lyophilization, an acetate buffer of pH 4.8-5.5, a surfactant and polyol. The invention is useful for treating hemorrhagic shock, tinjury, e.g. resulting from burns, stroke including ischemic and hemorrhagic stroke, myocardial infarction, inflammatory disorders adult respiratory distress syndrome (ARDS), hypovolemic shock, ul colitis, rheumatoid arthritis and B-cell lymphomas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the protease removes the zipper. The methods can be used to purify proteins from cell cultures. They are especially useful for isolating antibodies. The methods overcome the problem of reagent leakage into the protein as is the case in prior art immobilized modification systems. By using a opposite charge filter the reagent can be excluded from the sample, preventing contamination. The present sequence represents the recombinant humanised anti-CD18 antibody (rhuMAb CD18) heavy chain, which is used in an example from the present invention
                                                                                                                                                         Stable aqueous pharmaceutical formulation for treating hemorrhagic thermal injury, stroke, and myocardial infarction, comprises an ant not subjected to prior lyophilization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antibody; lyophilization; hemorrhagic myocardial infarction; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 300

                                                                                                                                                                                                                                                                                                                     Producing culturing and heavy
                    The present sequence is that of an anti-CD18 antibody heavy chain including a heat stable enterotoxin II (STII) secretion signal and a C-terminal leucine zipper domain. This recombinant heavy chain is produced by host cells transformed with claimed vector pxCD18-7T3 (see ABZ82071). The plasmid contains 2 translational units that temporally separate the transcription of the antibody light (see ABF72745) and heavy chains. Expression of the light chain is under the control of the phoA promoter, while expression of the heavy chain is under the control of the inducible TacII promoter. In an example from the invention, Escherichia coli 59A7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Unidentified.

Heavy chain production was then induced by addition of IPTG, and F(ab')2 assembly occurred almost immediately. A yield of 4.6 +/- 0.5 g/l assembly occurred shout nearly 2-fold increase on the yield obtained using a single promoter system. This is an example of the process of the invention for production of recombinant antibodies in a host cell system, with temporally separated expression of the light and heavy chains. Properly assembled, soluble and functional antibodies (or their fragments) can be produced in high yields for diagnostic or therapeutic applications, including treatment of cancer or autoimmune diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC cerebral artery, comprises administering anti-CD18 antibody to increase CC cerebral blood flow and/or reduce the size of the area of brain that CC dies, without removing the arterial obstruction. CD18, is upregulated in CC patients after ischaemic stroke or transient ischaemic attack (stroke CC symptoms last less than 24 hours with complete recovery). Treatment with CC anti-CD18 antibodies can increase cerebral blood flow and/or reduce brain CC infarct size, improving clinical outcomes in focal ischaemic strokes in CC mammals, particularly in humans. The method provides an alternative to CC thromboembolism (thrombosis or embolism), particularly where thrombolytic therapy for treating ischaemic strokes caused by CC thromboembolism (thrombosis or embolism), particularly where thrombolytic drugs exacerbate bleeding, or is unsuitable because of the time delay CC between stroke onset and diagnosis. Thrombolytic agents (e.g. tissue CC plasminogen activator) may also be administered before, after or CC simultaneously with the anti-CD18 antibody. Alternatively, the method can be used to treat the third main type of ischaemic stroke, systemic CC hypoperfusion, e.g. resulting from cardiac arrest or drowning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a method for improving the clinical outcome in focal ischaemic stroke by administering novel anti-CD18 antibody which has cerebroprotective properties. The invention particularly describes a method of treating focal ischaemic stroke caused by the obstruction of a main cerebral artery which comprises administering an anti-CD18 antibody to increase the blood flow or reduce the infarct size, where: (1) the antibody binds to an extracellular domain of CD18 and inhibits or reduces the ability of the cell expressing CD18 to bind to endothelium, (2) the antibody binds CD18 with an affinity of less than 4 nm, or (3) the antibody dissociates CD11b/CD18 complex. This sequence represents the

                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of increasing cerebral blood flow and/ or reducing infarct size in focal ischaemic stroke caused by obstruction of a main cerebral artery in a human, comprising co-administering tissue plasminogen activator and anti-CD18 antibody about 3-5 hours after the stroke. The method is used to improve the clinical outcome in acute ischaemic stroke and to provide an alternative to thrombolytic therapy for treating thromboembolic stroke, particularly where thrombolytic therapy has been unsuccessful or is contra-indicated. The present sequence represents the full length humanised H52 antibody (huH52), heavy chain used in the method of the invention
